

Here we came with a brilliant idea to save many habitats in some rural areas especially villages which are very close dams and reservoirs

Now we will explain how it will be useful for villages very near to dams

we will tie up with network companies ie.(idea,airtel,jio,Vodafone)

Will intimate them about rainfall through sms due to problem of scarcity

Smartphones with them they are unable to get exact weather report . So, they are

Not getting intimates from government so, they are losing their livelihood also

It is a very big loss to them some of them not only losing their livelihood also lives

This all is because of delay in information from dam officers and also unconditional

Climate in that area this problem will be rectified by our project called analysis of

Weather report

It will not only be useful for the flood prone areas and also drought prone areas we will explain it now

As we will intimate about weather before four or five weeks before so people get information

About rain neither save water or use it normally so we can also use this project in whole india to

give exact information to people about the weather in india

Thank you
